General Information on Roots Vacuum Pumps

Applications

For many years now Roots vacuum pumps have been well established in the area of vacuum technology. In combination with backing pumps, which compress against the atmosphere, these pumps offer the following advantages:

Shifting the Operating Pressure into the High Vacuum Range

As a rule of the thumb one may say that Roots vacuum pumps are capable of improving the attainable ultimate pressure of a pump system by a factor of 10. With two Roots vacuum pump stages and a corresponding backing pump it is possible to attain pressures in the range down to 10^{-5} mbar (0.75×10^{-5} Torr). Under certain circumstances this will make the use of additional high vacuum pumps (turbo-molecular pumps or diffusion pumps) unnecessary.

Comparison of pumping speed characteristics with and without pressure equalization line

Multiplied Pumping Speed

Due to the non-contact rotation of the impellers, Roots vacuum pumps are able to run at higher speeds. Thus a high pumping speed is obtained with a relatively small size pump. Pumping speeds in excess of 1000 m³/h (589 cfm) can only be attained with Roots vacuum pumps.

When selecting the right kind of backing pump (sizing) it will be possible to pump large quantities of gas in connection with smaller backing pumps. Energy consumption of such a pump system is much less compared to a single backing pump offering the same pumping speed.

Pump system with RA Roots vacuum pumps

The use of Roots vacuum pumps in the area of vacuum technology has resulted in further specializations and improvements:

- Through an integrated bypass (pressure equalization line) it is also possible to utilize the pumping speed of the Roots vacuum pump at high pressures and large quantities of gas at an early stage. This reduces the pumpdown time especially for cyclic operation (see figure "Comparison of pumping speed characteristics with and without pressure equalization line").
- High-purity gases or hazardous gases impose strict requirements on the leak-tightness of the system. Canned motors are hermetically sealed. There are no seals in

contact with the atmosphere which might be subject to wear. This prevents leaks and failures due to oil leaks. A service life of over 20000 hours without maintenance is quite common.

- Tolerances and the quality of the balancing combined with forced lubricated bearings and toothed gears permit high speeds and the use of frequency converters. Thus it is possible to attain a high pumping speed while the process is in progress and to reduce the speed when the process has been stopped or while changing the batch. This results in a lower consumption of energy and a longer service life with uncompromised reliability.

- Conversion from vertical to horizontal flow is easily implemented and can be performed at the place where the pump has been installed. Thus the pump can be adapted more closely to the operating conditions of your system.

Lately, a further characteristic is gaining prominence: Roots vacuum pumps are capable of compressing the media in the pump chamber without the presence of any further media. This mostly avoids interaction between different media in the pump itself and also in the connected vacuum chamber. Therefore

- the medium which is pumped is not contaminated with lubricants or sealants; complex accessories (exhaust filters, separators, etc.) are not needed;
- the lubricant in the side chambers is hardly affected, so that service life is not reduced;
- backstreaming of oil from the backing pump into the connected vacuum chamber is prevented.

The effective air cooling arrangement reduces operating costs to a minimum. Cooling water is not required.

These characteristics make the Roots vacuum pump attractive for almost all rough and medium vacuum applications.

Pump system with RA Roots vacuum pump and SOGEVAC rotary vane vacuum pump

Semiconductor Technology

In the area of semiconductor technology, Roots vacuum pumps are found in etching processes among others, and in use with dry compressing vacuum pumps.

The pumping speed of the combination of backing pumps amounts to 200 to 500 m³/h (118 to 295 cfm) and it ensures a cut-in pressure of 10⁻¹ mbar (0.75 x 10⁻¹ Torr) for the turbomolecular pump. In the case of dry compression, corrosive gases which also have a high particulate content must be pumped.

Canned motors and PFPE fluids provide a good seal against the outside and allow long periods between servicing, high reliability and thus very low operating costs (WS PFPE types).

Specific suitable for this processes and use in clean rooms are Roots vacuum pumps filled with PFPE and water-cooled motors.

These kind of motor has only a little heat dissipation.

Central Vacuum Supply Systems

Large Roots vacuum pumps, usually in connection with single-stage rotary vane vacuum pumps serve several consumers of vacuum (packaging machines, for example) at the same time.

Operational diagram of a single-stage Roots vacuum pump (with vertical pumping action)

Due to the uncontrolled influx of gas, a high of pumping speed must be attained quickly, in order to keep the vacuum (1 to 30 mbar (0.75 to 22.5 Torr)) permanently available to all consumers. This in particular, is implemented by Roots vacuum pumps having a pressure equalization line (WAU types).

Chemistry

Replacement of vapor jet or gas jet pumps on liquid ring pumps in drying and distillation plants is necessary for attaining the required operating pressure of about 1 mbar (0.75 Torr). Reduction of operating costs by entirely eliminating vapor or gas quantities includes separation of these on the pressure side (WA and RA types).

Laser Systems

Continuous circulation of the gas in order to remove heat from a closed cycle in which pressure differentials of up to 100 mbar (75 Torr) must be maintained. The tough requirements regarding purity necessitate a total absence of contamination by oil and dust. This is ensured by reducing the pressure level in the oil chambers as well as by coating the pump chamber. The pumps are assembled and tested under clean room conditions.

The canned motor ensures a high degree of leak-tightness to the outside and permits operation in connection with a frequency converter (WSLF types).

Operating Principle

Roots vacuum pumps, which are also called Roots blowers, are rotary plunger type pumps where two symmetrically shaped impellers rotate in opposite directions inside the pump housing.

The figure-of-eight rotors are synchronized by a gear which ensures that the impellers are counter-rotating in such a way, that they are near to one another and to the housing without actual contacting.

In rotor positions I and II (see figure "Operational diagram of a single-stage Roots vacuum pump (with vertical pumping action)") the volume of the intake is increased. As the rotors turn further to position III a part of the volume is cut off from the intake side.

In position IV this volume is opened to the exhaust side and gas under fore-vacuum pressure (higher than the intake pressure) flows in. This gas compresses the gas coming from the intake. As the rotors turn further the compressed gas is ejected through the exhaust flange.

This process repeats itself twice for each rotor per full turn.

As the rotors do not come into contact with the pump's housing Roots vacuum pumps may be operated at high speeds. Thus a high pumping speed is obtained from comparably small pumps.

The pressure difference and the compression ratio between intake and exhaust is limited in Roots vacuum pumps.

In practice the maximum attainable pressure difference is of significance only in the rough vacuum range ($p > 10 \text{ mbar}$ ($p > 7.5 \text{ Torr}$)) whereas in the medium vacuum range ($p < 1 \text{ mbar}$ ($p < 0.75 \text{ Torr}$)) the attainable compression ratio is of importance.

Roots vacuum pumps from Oerlikon Leybold Vacuum have been designed to specially meet the requirements of the fine vacuum range. They are normally used in connection with backing pumps (exception RAV) or in closed gas cycles (WSLF series).

Design

The pump chamber of Roots vacuum pumps is free of any sealing agents or lubricants. Only the toothed wheels of the synchronous gear are lubricated with oil. Toothed gear wheels and bearings of the RUVAC are placed in two side chambers which also contain the oil reservoir. These two side chambers are separated from the pump chamber by piston ring seals.

Suitably designed oil supply systems in both chambers ensure that a sufficient quantity of oil is supplied to the gear wheels and bearings at all permissible speeds.

Almost all RUVAC Roots vacuum pumps are designed for a horizontal and vertical pumping action.

Pump system consisting of RUVAC WAU 1001 and SOGEVAC SV 200

Types

Various types of Roots vacuum pumps have been developed to ensure optimum adaptation to the widely varying applications for this type of pump.

- Flange mounted motor

The drive shaft of the pump is directly connected to an electric motor via a flexible coupling. The required seal of the drive shaft against atmospheric pressure is obtained by oiled shaft seals.

- Canned motor

In the canned motor, rotor and stator pack are separated by a vacuum-tight can made of a non-magnetic material. The rotor operates on the drive shaft of the pump in the vacuum, so that a shaft seal which would be subject to wear is not required.

- Hermetically sealed motor

The hermetically sealed motor is the latest technology step for Roots vacuum pumps. It integrates the complete motor assembly into the vacuum reaching the same efficiency as a standard flange mounted motor without the need of a shaft seal. The hermetically sealed motor is the most compact, efficient and reliable motor technology available for roots pumps.

- Pressure equalization line

The integrated pressure equalization line connects the exhaust flange to the intake flange through a differential pressure valve.

This valve opens at a high pressure differential between the flanges. Part of the gas then flows through this line back to the intake flange. This is why the Roots vacuum pump may be switched on at atmospheric pressure together with the backing pump. This also increases the pumping speed of the pump combination at high intake pressures.

- Special ACE vibration absorber

These pumps are best used in applications involving frequent pump-down cycles. The vibration absorber is of an oil sealed or filled design where minute amounts of oil may enter the vacuum system via the piston of the vibration attenuator.

RUVAC WA/WAU, WS/WSU

The series WA/WAU Roots vacuum pumps are provided with directly flange-mounted air-cooled standard three-phase motors. The oiled radial sealing rings of the RUVAC WA/WAU for sealing the shaft against the atmosphere are made of FPM (FKM) (fluoropolymer).

The WH/WHU series pumps have a water cooled hermetically sealed motor.

Roots vacuum pumps of the series WAU/WSU/WHU are provided with an additional integrated pressure equalization line and a differential pressure valve.

Pumps from these series are supplied with a vertical pumping action as standard.

Using the RUVAC WS and RUVAC WH in combination with a frequency converter

Simulation of a pressure equalization line

The available frequency converters have been matched to the pump so that the possibility of mechanically overloading it is excluded. In the case of a pressure difference which is too high, the rotational speed of the pump is automatically reduced until its load drops in to the permissible range.

Operation at any rotational speeds

The frequency converter can be used to adjust the pumping speed of the Roots pump during operation. This allows maximum flexibility to find the right setup for any application.

Increasing the pumping speed

The pumps are prepared to handle a maximum rotational speed of 4200 rpm - 7200 rpm depending on the pump size.

Therefore the use of a frequency converter permits an increase in the nominal pumping speed of up to 140%.

Note

Please enquire about possibly existing usage limits (process dependent).

RUVAC WSLF

The pumps of these series are especially adapted Roots vacuum pumps from the RUVAC WS series which are intended for operation with gas lasers.

They are driven by a canned motor so that a shaft seal for sealing against atmospheric pressure is not required.

Air-cooled series with nominal pumping speeds of $1000 \text{ m}^3 \times \text{h}^{-1}$ (589 cfm) are available.

The RUVAC WSLF series with increased motor ratings is intended for operation in connection with frequency converters.

These pumps are available with nickel-plated or plasma-nitrated surface as standard.

All pumps of these series are supplied with a horizontal pumping action.

Vertical pumping action is available upon request.

RUVAC RA

RA series Roots vacuum pumps are equipped with a directly flange-mounted three-phase motor (RA 13000 via V-belt drive).

Schematic section through a RUVAC WA/WS (left) and a RUVAC WAU/WSU (right)

Backing Pumps

The backing pumps from Oerlikon Leybold Vacuum listed in the following are recommended for connection to the RUVAC Roots vacuum pumps:

- Rotary vane vacuum pumps
 - TRIVAC B with pumping speeds between $16 \text{ and } 65 \text{ m}^3 \times \text{h}^{-1}$ (9.4 and 38.3 cfm)
 - SOGEVAC with pumping speeds between $16 \text{ and } 1200 \text{ m}^3 \times \text{h}^{-1}$ (9.4 and 707 cfm)
- Dry compressing piston vacuum pumps
 - ECODRY M with pumping speeds between $38 \text{ and } 48 \text{ m}^3 \times \text{h}^{-1}$ (22 and 28 cfm)
- Dry compressing screw vacuum pumps
 - SCREWLINE SP250 and SP630 with pumping speed of 250 and $630 \text{ m}^3 \times \text{h}^{-1}$ (147 and 371 cfm)
- Rotary piston vacuum pumps
 - E and DK with pumping speeds between $200 \text{ and } 250 \text{ m}^3 \times \text{h}^{-1}$ (117.8 and 147.3 cfm)
- Roots vacuum pumps with pre-inlet cooling
 - RUVAC RAV G with pumping speeds between $250 \text{ and } 8100 \text{ m}^3 \times \text{h}^{-1}$ (147.3 and 4770.9 cfm)
- Liquid ring vacuum pumps upon request

Accessories

Frequency Converter V1000

This frequency converter is specially designed for the new RUVAC WH series. For this frequency converter much equipment is available.

For more information see Technical Data at "RUVAC WH Roots Vacuum Pumps with Water-Cooled Hermetically Sealed Motors".

For each Roots vacuum pump size, a matching frequency converter is available.

Frequency Converter RUVATRONIC RT 5

The electronic frequency converters RUVATRONIC RT 5/251 to 5/16 000 have been designed specially for use in connection with Oerlikon Leybold Vacuum Roots pumps of the RUVAC WA and WS series.

The main characteristics of the RUVATRONIC RT 5 are:

Simulation of a pressure equalisation line

The software of the frequency converters is adapted to each pump and ensures that the risk of mechanically overloading the pump can be excluded. In the case of too high pressure differences, the rotational speed will be decreased automatically until the load is reduced to within the pump's limits. RUVAC Roots vacuum pumps of the types WA, WS and RA (without pressure equalisation line) can be switched on together with the forepump at atmospheric pressure. Through this, the pumpdown time can be reduced drastically. The minimum pumping speed of the backing pump needs to be considered in this case.

In connection with this kind of operation, the minimum pumping speed of the backing pump needs to be observed.

Pump	Required pumping speed for the backing pump
WA/WS 251	$50 \text{ m}^3/\text{h}$ (29 cfm)
WA/WS 501	$100 \text{ m}^3/\text{h}$ (59 cfm)
WA/WS 1001	$200 \text{ m}^3/\text{h}$ (118 cfm)
WA/WS 2001	$410 \text{ m}^3/\text{h}$ (241 cfm)
WH 700/702	$140 \text{ m}^3/\text{h}$ (82 cfm)
WH/WHU 4400	$880 \text{ m}^3/\text{h}$ (518 cfm)
WH/WHU 7000	$1400 \text{ m}^3/\text{h}$ (824 cfm)
RA 3001	$650 \text{ m}^3/\text{h}$ (383 cfm)
RA 5001	$930 \text{ m}^3/\text{h}$ (547 cfm)
RA 7001	$1250 \text{ m}^3/\text{h}$ (736 cfm)
RA 9001	$3240 \text{ m}^3/\text{h}$ (1907 cfm)

Operation at up to 3 predefined speeds

Via floating contacts, the pump can be operated at one of the 3 predefined speeds. Switching over to another predefined speed is possible during operation.

Operation at any rotational speed

With a 0 to 10 V signal, any speed can be predefined to operate the pump between the minimum and maximum rotational speed. The software reliably ensures that the rotational speed cannot drop below the minimum speed or exceed the maximum speed.

Increase in the pumping speed

By operating the Roots vacuum pumps at frequencies over 50 Hz, the nominal pumping speed of the pumps can be increased. Depending on the type of pump, an increase between 20 and 100% is possible.

Note

Please enquire about possible application limitations (process dependent).

Dust Separators and Dust Filters

Vacuum processes with a high particle count or involving significant quantities of dust require special measures for protecting the vacuum pumps.

Dust separators and dust filters can be found in chapter "Accessories" of Product Section C08.

Products

RUVAC WA/WAU Roots Vacuum Pumps with Air-Cooled Flange-Mounted Motors

RUVAC WAU 2001 single-stage Roots vacuum pump, depicted with a DN 160 ISO-K collar flange

Advantages to the User

- Two air-cooled series, each with four models
- Reliable and trouble-free
- Sealing rings with their housing can be readily replaced
- Shaft seals and elastomer seals made of FPM (FKM)/Viton
- Air-cooled standard motors in accordance with IEC dimensions eg. NEMA dimensions
- Easy to exchange with custom motors
- Integrated pressure equalization line for protection against overloading at high pressures on WAU models
- Pumping direction may be changed as required
- ATEX versions compliant to 94/9/EC possible

Typical Applications

- For oil-free compression of gases and vapors in combination with a backing pump
- Short cycle pumping processes also in the presence of large quantities of gas and vapor

Supplied Equipment

- RUVAC WA/WAU are supplied as standard for a vertical pumping action, horizontal pumping action upon request
- Mineral oil N 62 is used as standard
- Gasket in the intake flange with dirt sieve
- The required oil filling is included in separate bottles

You can find this questionnaire at the end of the full-line catalog together with the fax forms or in the Internet under "www.oerlikon.com/leyboldvacuum" under Download Documents in the area Documentation.

RUVAC WS/WSU Roots Vacuum Pumps with Air-Cooled Canned Motors

Single-stage Roots vacuum pump RUVAC WSU 1001 shown with ISO-K 100 rotatable flanges

Advantages to the User

- Two series, each with four models
- Highly leak-tight air-cooled pumps driven by a air-cooled canned motor
- Lubricated with mineral oil. RUVAC WS/WSU PFPE with per-fluoropolyether (PFPE)
- WS and WS PFPE pumps are identical except for the lubricant and the shipping package
- No thermal problems due to the speed independent cooling arrangement using a separately connected fan, thus no thermal problems at low speeds
- Over-temperature switch in the stator coil of the motor
- All elastomer seals made of FPM (FKM)/Viton
- Integrated pressure equalization line with differential pressure valve prevents overloading on WSU model
- RUVAC WS 251 to 2001 may be operated over a wide frequency range using a frequency converter
- No shaft feedthrough to the atmosphere, thus particularly leak-tight
- Pumping direction may be changed as required

Typical Applications

- For applications which require a high pumping speed at pressures between 10^{-2} and 10^{-4} mbar (0.75×10^{-2} and 0.75×10^{-4} Torr)
- Used where the possibility of contamination due air ingress or pumped media leakage must be avoided
- Suction or pumping of high-purity or radioactive gases
- Is used in clean rooms where the air must not be recirculated by the motor's fan

Supplied Equipment

- The required oil or PFPE filling is included in separate bottle
- If no other type of oil is stated, then mineral oil N 62 is used as standard
- Purged with nitrogen for corrosion protection
- Gasket in the intake flange with integrated dirt sieve

Pumping speed of the RUVAC WS/WSU, 50 Hz

RUVAC WS/WSU (W) PFPE Roots Vacuum Pumps with Water-Cooled Canned Motors

Single-stage Roots vacuum pump RUVAC WS 501 W shown with ISO-K 63 rotatable flanges

Advantages to the User

- Two series
- Highly leak-tight air-cooled pumps driven by a water-cooled canned motor
- RUVAC WS/WSU(W) PFPE lubricated with perfluoropolyether (PFPE)
- WS and WSU PFPE pumps are identical except for the lubricant and the shipping package
- Over-temperature switch in the stator coil of the motor
- All elastomer seals made of FPM (FKM)/Viton
- Integrated pressure equalization line with differential pressure valve prevents overloading on WSU model
- RUVAC WS 501 bis 2001 may be operated over a wide frequency range using a frequency converter
- No shaft feedthrough to the atmosphere, thus particularly leaktight
- Pumping direction may be changed as required

Typical Applications

- For applications which require a high pumping speed at pressures between 10^{-2} and 10^{-4} mbar (0.75×10^{-2} and 0.75×10^{-4} Torr)
- Used where the possibility of contamination due air ingress or pumped media leakage must be avoided
- Suction or pumping of high-purity or radioactive gases
- Is used in clean rooms where the air must not be recirculated by the motor's fan

Supplied Equipment

- The required oil or PFPE filling is included in separate bottle (exceptions are marked)
- PFPE is used as standard
- Purged with nitrogen for corrosion protection
- Gasket in the intake flange with integrated dirt sieve

¹⁾ Prepared for operation with PFPE, without PFPE filling

Pumping speed of the RUVAC WS/WSU (W) PFPE, 50 Hz

RUVAC WH 700/702 Roots Vacuum Pumps with Water-Cooled Hermetically Sealed Motors for PFPE, Anderol and Mineral Oil

RUVAC WH 700 single-stage Roots vacuum pump

Advantages to the User

- Lower energy costs through innovative motor technology (efficiency class 1)
- Minimized space requirements due to an extremely compact design and the possible direct adaptation to backing pumps
- Easy system integration
- Optimum price-to-performance ratio; high pumping speed (1730 m³/h at 120 Hz with optional frequency converter)
- Integrated water cooling system for installation within closed systems
- Parts in contact with the cooling water are made of stainless steel (corrosion-free)
- Trouble-free operation with toxic or corrosive media owing to the hermetically sealed motor and the purge gas option
- No shaft seals towards atmosphere, therefore high reliability, long service intervals and no oil leaks

Typical Applications

The Roots pumps of the WH series were developed for deployment in all applications with high requirements regarding operating pressure, cycle times and system uptime.

- Solar industry
- Furnace construction
- Industrial coating processes
- Research
- Space simulation

Supplied Equipment

- RUVAC WA/WAU are supplied as standard for a vertical pumping action, no horizontal pumping action available
- Synthetic oil GS 555 is used as standard
- Gasket in the intake flange with dirt sieve
- The required oil filling is included in separate bottles

¹⁾ Only possible with frequency converter motor and external frequency converter

²⁾ To DIN 28 426 and subsequent numbers

³⁾ Higher pressure differences are possible

⁴⁾ Gas temperatures over 40 °C (104 °C) can result in a reduction of the pressure difference values; please consult Oerlikon Leybold Vacuum on this

⁵⁾ system for the bearings and the gear, and must be taken into account as soon as the speed is constant for over five minutes. When operating the pump below the minimum permissible speed for a period of time exceeding five minutes, such operation can damage the pump due to insufficient lubrication

⁶⁾ The cooling water quantity can be reduced provided the temperature of the discharged water does not exceed 45 °C (113 °C)

⁷⁾ Please note that the WH 700 W PFPE is equipped with two independent oil reservoir chambers. Both chambers must be filled separately, respectively emptied separately. Moreover, the oil levels must be checked separately during operation

⁸⁾ The typical operating frequency of the frequency converter is 8 kHz. The total harmonic distortion for the motor current amounts to 12% approx

RUVAC WH/WHU Roots Vacuum Pumps with Water-Cooled Hermetically Sealed Motors with Mineral Oil, Synthetic Oil or PFPE filling

RUVAC WH 4400 single-stage Roots vacuum pump with hermetically sealed motor

Advantages to the User

- Lower energy costs through innovative motor technology (efficiency class 1)
- Minimized space requirements due to an extremely compact design
- Easy system integration
- Optimum price-to-performance ratio; high pumping speed (9800 m³/h @ 70 Hz with optional frequency converter)
- Integrated water cooling system for installation within closed systems
- Parts in contact with the cooling water are made of stainless steel (corrosion-free)
- Trouble-free operation with toxic or corrosive media owing to the hermetically sealed motor and the purge gas option
- No shaft seals towards atmosphere, therefore high reliability, long service intervals and no oil leaks
- Flexible installation; selectable vertical or horizontal gas flow
- Secure operation and faster pump down in short cycle operation with optional bypass-line

RUVAC WHU with bypass line

- Maximum efficiency in short cycle operation for the WHU types with bypass line and newly developed control flap
- Reduced pumpdown time
- Pump start-up at atmospheric pressure possible
- Optimized cycle time for the control flap (patent pending); delivers an even faster response compared to operation with frequency converter
- Extreme contamination resistance of the control flap

Typical Applications

The Roots pumps of the WH series were developed for deployment in all applications with high requirements regarding operating pressure, cycle times and system uptime.

- Solar industry
- Furnace construction
- Industrial coating processes
- Research
- Space simulation

Supplied Equipment

- Pump will be delivered with standard shock absorbers
- Synthetic oil GS 555 is used as standard
- Gasket in the intake flange with dirt sieve
- The required oil filling is included in separate bottles

RUVAC WSLF Roots Vacuum Pumps for Laser Gas Systems

RUVAC WSLF 1001 LF Roots vacuum pump

Roots vacuum pumps driven by canned motors are available for gas laser systems.

Advantages to the User

- A gas mixture of helium, nitrogen and carbon monoxide is continuously circulated at a reduced system pressure
- High pumping speed from a small, quiet running pump
- Operation with a frequency converter is possible
- Nickel-plated pump chamber surfaces
- Through an additional vacuum pump the bearing chambers may be evacuated to a pressure lower than the pressure within the pumping chamber of the RUVAC
- Water-cooled oil separating system
- Integrated oil separating system for extended maintenance intervals

Typical Applications

- Processing of ferrous and non-ferrous materials like welding, cutting and surface refinement

Technical Note

- The gas circulation system must be very clean and entirely free of hydrocarbons

Supplied Equipment

- Horizontal pumping action as standard
- With oil pressure switch and oil drain facility
- The required oil filling is included separately (special oil ANDEROL 2100 HTCL)
- Purged with nitrogen for corrosion protection

RUVAC RA Roots Vacuum Pumps with Flange-Mounted Air-Cooled Motors

RUVAC RA 5001 single-stage Roots vacuum pump

Roots vacuum pumps offering a high pumping speed.

Advantages to the User

- Oil immersed radial shaft seals made of FPM (FKM) for sealing against the atmosphere
- Use of universal IEC motors (50/60 Hz)
- The motors fulfil in Europe (50 Hz) the efficiency requirements in accordance with EFF1
- In the USA (60 Hz) the motors are UL approved and fulfil the efficiency requirements in accordance with EPAC
- If required with external pressure equalisation line and differential pressure valve so that the pump may be switched on jointly with the backing pump at atmospheric pressure
- Motors can easily be exchanged for special voltage motors. Explosion protected motors and motors for special main frequencies upon request
- Over-temperature switch in the stator coil of the motor
- Rugged dry compressing vacuum pump
- Most reliable even under rough operating conditions
- ATEX versions compliant to 94/9/EC possible

Typical Applications

- Large vacuum systems like sintering and annealing furnaces which require multi-stage pumpsets
- In large vacuum rectification systems Roots vacuum pumps with postcondensers for compressing of vapors

Custom Pumps

- If required the RA pumps are also available as C versions (chemical versions)
- Pumps made of special materials may be specified as well as pressure burst resistant pumps
- Custom designed pumps for pumping speeds of 250 m³/h to 2000 m³/h (147.3 to 1178 cfm)

Technical Note

For operation ordering of oil is necessary (see section "Miscellaneous")

Accessories

Pressure Switches

The RUVAC vacuum pumps may be switched on and off automatically through a pressure switch driven by a SV 110 switching amplifier and a contactor.

The pressure switch may be installed in the intake of the RUVAC using a screw-in adaptor, an elbow and two centering and two clamping rings.

Upon request the pressure switch may be set by Oerlikon Leybold Vacuum to a fixed value. Please state this pressure value in your order.

Vacuum Pump Oils

Lubricating oils for rotary vane vacuum pumps need to fulfil demanding requirements. Their vapor pressure must be low at high temperatures and the water content and water uptake must be minimal. Their viscosity characteristics need to be flat, lubricating properties need to be excellent and resistant against thermal decomposition and increased mechanical stress.

All the vacuum pump oils listed in the following have been subjected in our factory laboratories to very comprehensive tests closely resembling the conditions encountered in practice by the pumps from the RUVAC series.

Under vacuum engineering conditions, lubricating oils may react very differently compared to what is being expected of them.

In order to ensure the best possible performance of the Oerlikon Leybold Vacuum pumps, the use of vacuum pump oils qualified by Oerlikon Leybold Vacuum is required.

When using not suitably qualified third party oils, the oil change intervals and the performance of the vacuum pump may be reduced. Also unwanted deposits may occur which may even cause severe damage to the vacuum pump.

Our oils are subjected to an involved qualification process with respect to their technical suitability in our vacuum pumps.

Our warranty commitment is dependent on the usage of lubricating oils which are qualified by us.

No liability will be assumed for any kind of damage caused through the usage of types of oil which have not been qualified or which are unsuitable.

In order to adapt the pumps to the different applications of our customers, different types of oil are used in the RUVAC pumps.

Please note that owing to differing properties not all types of oil may be used in all pumps of the RUVAC series.

If you can not find the combination of pump and oil you require by way of a Part. No., please ask us for a quotation.

Lubricant Types

Mineral Oils

Mineral oils are products distilled and refined from crude oil. These do not consist of precisely defined compounds but rather consist of a complex mixture. The way in which the mineral oil is pre-treated and its composition are decisive as to the applications it will be suited for. Depending on the distribution of the hydrocarbons and the dominance of certain properties, mineral oils are grouped according to paraffin-base, naphthenic and aromatic. For the purpose of attaining especially low ultimate pressures, mineral oils must be selected on the basis of a core fraction.

The thermal and chemical resistance of mineral oils has been found to be adequate in the majority of applications. They offer a high degree of compatibility with elastomers and resistance to hydrolysis.

Synthetic Oils

Synthetic oils are produced by a chemical reaction. The group of synthetic oils includes liquids differing widely as to their chemical structure and composition. Correspondingly their physical and chemical properties differ considerably. Synthetic oils are used in those cases where special properties of the oil are required which can not be fulfilled by mineral oils.

The oils given in the following belong to the group of synthetic oils:

Ester Oils

Ester oils are organic compounds which excel especially through their high thermal resistance to cracking compared to mineral oils. Chemical resistance is generally quite good, but will depend on the type of ester oil. Elastomer compatibility and resistance against hydrolysis are not so good compared to mineral oils.

Perfluorinated polyether (PFPE)

These are oils which are only composed of carbon (C), fluorine (F) and oxygen atoms (O). The existing C-O and C-F bonds are highly stable. For this reason PFPE oils are practically inert against all chemical and oxidising influences.

Perfluorinated polyether will not polymerise under the influence of high energy radiation.

PFPE is non-flammable. Oerlikon Leybold Vacuum NC 1/14 has the approval of BAM (Federal Institute for Materials Research and Testing) for pumping of pure oxygen.

Perfluorinated polyether are used when pumping strongly reactive substances like oxygen (O₂), fluorine (F₂) and uranium hexafluoride (UF₆). Regarding Lewis acids (for example, boron trifluoride (BF₃), aluminum trichloride (AlCl₃)) they are not completely inert. Here reactions may take place at temperatures over 100 °C (212 °F).

Perfluorinated polyether are thermally highly stable. Thermal decomposition may only take place at temperatures of over 290 °C (554 °F).

Caution: Perfluorinated polyether will – when decomposed – release toxic and corrosive gases: hydrogen fluoride (HF), carbonyl difluoride (COF₂). For this reason open fires must be avoided in the workspace where PFPE is being used. Do not smoke in the workspace where PFPE is being used.

Only suitably prepared pumps must be used in connection with perfluorinated polyether, since it is essential that the pumps be free of hydrocarbons.

Changing from one basic type of oil to PFPE must be left exclusively to authorised Service Centers. The pump will have to be fully disassembled and carefully cleaned. Gaskets and filters will have to be exchanged and suitable greases will have to be used.

Safety data sheets are available to professional users from:

E.mail “documentation.vacuum@oerlikon.com” or Internet “www.oerlikon.com/leyboldvacuum”.
